#### **Maltofer**®

## **Syrup**

Pharmaceutical form: oral solution

## Qualitative and quantitative composition

1 ml of syrup contains 10 mg of iron as iron(III)-hydroxide polymaltose complex (IPC).

Excipients: purified water, sorbitol solution (70%), sucrose, ethanol, cream essence, methyl hydroxybenzoate (E218), propyl hydroxybenzoate (E216) and sodium hydroxide.

### **Properties/Effects**

Pharmacotherapeutical group: iron preparation.

ATC Code: B03AB05

# Mechanism of action

The polynuclear iron(III) hydroxide core in IPC is surrounded at its surface by a number of non-covalently bound polymaltose molecules, which leads to an average total molecular weight of around 50 kDa. The polynuclear iron core of IPC has a structure similar to that of the physiological iron storage protein ferritin. IPC is a stable complex and releases no large quantities of iron under physiological conditions. Due to its size, the magnitude of IPC diffusion taking place through the mucosa is around 40 times less than in most water-soluble iron(II) salts present in aqueous solution as a hexaaqua-iron(II) complex. Iron is absorbed in the intestines from IPC through an active mechanism.

## **Pharmacodynamics**

The iron absorbed is bound to transferrin and is used for Hb synthesis in the bone marrow or stored primarily in the liver bound to ferritin.

## Clinical Efficacy

The efficacy of Maltofer compared to a placebo or similar preparations with different iron formulations in terms of normalising haemoglobin values and replenishing iron stores has been demonstrated in numerous clinical studies in infants, children, adolescents and adults. Both solid and liquid galenic forms of IPC were used in these studies. The primary goal of an oral iron replacement is to maintain the body's own iron stores within normal limit values (to prevent an iron deficiency, e.g. in case of increased requirements), replenish iron stores or correct existing iron deficiency anaemia.

# Clinical studies in adults

A total of 11 controlled clinical studies have been carried out with IPC monopreparations in comparison with a placebo and/or oral iron(II) preparations.

A total of more than 900 patients were involved, and approximately 500 of these patients received IPC mono-preparations. The patient population studied demonstrated no relevant differences in haematological and iron parameters (haemoglobin (Hb), mean red blood cell haemoglobin (MCV), serum ferritin) at the start of treatment. The oral iron replacement with IPC at a dose of 100–200 mg iron/day for several weeks up to a maximum of 6 months demonstrated a clinically relevant increase in iron and haematological parameters at the end of treatment compared to those at the start of treatment. The improvement in haematological parameters (Hb, MCV, serum ferritin) after a 12-week treatment with IPC was comparable to treatment with iron(II) sulphate.

The efficacy of IPC compared to iron(II) sulphate was investigated on the basis of a meta-analysis of 6 prospective, randomised clinical studies in adult patients with iron deficiency anaemia. The total number of patients included in the study was 557; 319 patients received IPC and 238 patients iron(II) sulphate. The pooled mean haemoglobin values at the start of treatment were  $10.35 \pm 0.92 \, \text{g/dL}$  (IPC) and  $10.20 \pm 0.93 \, \text{g/dL}$  (iron(II) sulphate). After an average treatment period of 8 to 13 weeks with equivalent posology, mean haemoglobin values were determined  $12.13 \pm 1.19 \, \text{g/dL}$  (IPC) and  $11.94 \pm 1.84 \, \text{g/dL}$  (iron(II) sulphate), p=0.93 increases in haemoglobin were greater after a longer treatment duration for both iron formulations.

#### Clinical studies in children and adolescents

The use of Maltofer in children and adolescents (18 years old or younger) was investigated in a number of clinical studies involving over 1000 patients. The efficacy of Maltofer in terms of improving iron values compared to the placebo or comparable preparations with different iron formulations was thereby confirmed.

#### **Pharmacokinetics**

#### **Absorption**

Studies with radio-labelled IPC show a good correlation between iron absorption and build-up of iron in haemoglobin. The relative absorption of iron correlates with the degree of iron deficiency (i.e. the greater the iron deficiency, the higher the iron absorption). In contrast to iron(II) salts, it was determined that food had no negative effect on the bioavailability of iron from Maltofer: significantly increased bioavailability of iron with concomitant ingestion of food was demonstrated in a clinical study, while three other studies showed a positive trend but no clinically significant effects.

#### Elimination

Iron that is not absorbed is eliminated in the faeces.

#### **Preclinical data**

Non-clinical data obtained for IPC does not reveal any special hazards for humans based on conventional studies of individual dose toxicity and repeated dose toxicity, genotoxicity or reproduction and development toxicity.

#### Other information

The  $LD_{50}$  of IPC, which was determined in animal trials with mice and rats, was higher than an orally administered dose of 2,000 mg of iron per kg of body weight.

## Therapeutic indications

Treatment of iron deficiency without anaemia and iron deficiency anaemia. Prophylactic therapy of iron deficiency during pregnancy.

## **Posology**

Dosage and duration of therapy are dependent upon the extent of iron deficiency.

Iron deficiency anaemia: the therapy takes about 3–5 months until a normalisation of the haemoglobin value is achieved. Afterwards the therapy should be continued for several weeks, or for pregnant women, at least until the end of the pregnancy with a dosage such as described for iron deficiency without anaemia in order to replenish the iron stores.

Iron deficiency without anaemia: the therapy takes about 1–2 months.

|                        | Iron deficiency      | Iron deficiency  | Prophylactic  |
|------------------------|----------------------|------------------|---------------|
|                        | anaemia              | without anaemia  | therapy       |
| Infants (up to 1 year) | 2.5–5 ml daily (25–  | _*               | _*            |
|                        | 50 mg iron)          |                  |               |
| Children (1–12 years)  | 5–10 ml daily (50–   | 2.5–5 ml daily   | _*            |
|                        | 100 mg iron)         | (25–50 mg iron)  |               |
| Children (>12 years),  | 10-30 ml daily (100- | 5–10 ml daily    | _*            |
| adults                 | 300 mg iron)         | (50–100 mg       |               |
|                        |                      | iron)            |               |
| Pregnant women         | 20-30 ml daily (200- | 10 ml daily (100 | 5–10 ml daily |
|                        | 300 mg iron)         | mg iron)         | (50–100 mg    |
|                        |                      |                  | iron)         |

<sup>\*</sup>Due to the lower required doses, these indications can only be treated with iron in drop form, such as Maltofer® drops.

# Method of administration

The daily dosage can be divided into separate doses or can be taken all at one time. Maltofer® syrup should be taken during or immediately after a meal. Maltofer® syrup

can be mixed with fruit and vegetable juices or with bottle-feed. The slight discolouration of the mixture does not affect either the efficacy of the product nor the taste of the drink to which it is added. The supplied measuring cup is used for an exact administration of the dosage.

## **Contraindications**

- Known hypersensitivity or intolerance to iron(III)-hydroxide polymaltose complex or any of the excipients
- Iron overload (e.g. haemochromatosis, haemosiderosis)
- Disturbances in iron utilisation (e.g. anaemia from lead-poisoning, sidero-achrestic anaemia, thalassaemia)
- Anaemia not caused by iron deficiency (e.g. haemolytic anaemia or megaloblastic anaemia due to vitamin B12 deficiency).

## Special warnings and special precautions for use

1 mL of Maltofer syrup contains 1.2 mg of sodium. This corresponds to 0.06% of the WHO-recommended maximum daily intake of 2 g of sodium for adults.

Maltofer syrup contains small quantities of ethanol (alcohol) of less than 100 mg per 30 mL (maximum daily dose).

Maltofer syrup contains methyl hydroxybenzoate (E218) and propyl hydroxybenzoate (E216). These can cause allergic reactions, even delayed reactions.

Information for diabetics: Maltofer® syrup contains 280 mg sorbitol and 200 mg sucrose corresponding to 0.04 bread units per 1 ml syrup.

Sorbitol can cause gastrointestinal disorders and has a slight laxative effect. Patients with hereditary fructose intolerance (HFI) should not take/receive this medicinal product. Sucrose can be harmful to the teeth.

Infections or tumours may cause anaemia. Since iron can be utilised only after correcting the primary disease, a benefit/risk evaluation is advisable.

During treatment with Maltofer\*, there may be dark discolouration of the faeces (stools).

# Interactions with other medicinal products and other forms of interaction

Interactions IPCwith tetracycline or aluminium hydroxide were investigated in 3 human studies (crossover design, 22 patients per study). No significant reduction in the absorption of tetracycline was observed. The plasma tetracycline concentration did not fall below the level necessary for efficacy. Iron absorption from IPC was not reduced by aluminium hydroxide or tetracycline. Iron(III) hydroxide polymaltose complex can therefore be administered at the same time as tetracycline or other phenolic compounds, as well as aluminium hydroxide.

Studies in rats with tetracycline, aluminium hydroxide, acetylsalicylate, sulphasalazine, calcium carbonate, calcium acetate and calcium phosphate in combination with vitamin D3, bromazepam, magnesium aspartate, D-penicillamine, methyldopa, paracetamol and auranofin have not shown any interactions with IPC.

Similarly, no interactions with food constituents such as phytic acid, oxalic acid, tannin, sodium alginate, choline and choline salts, vitamin A, vitamin D3 and vitamin E, soya oil and soya flour were observed in *in vitro* studies with IPC. These results suggest that IPC can be taken during or immediately after food intake.

The haemoccult test (selective for Hb) for the detection of occult blood is not impaired and therefore there is no need to interrupt iron therapy.

Concomitant administration of parenteral and oral iron is not recommended since the absorption of oral iron would be inhibited.

# **Pregnancy and lactation**

## Pregnancy

Clinical data of exposed pregnancies exhibited no undesirable effects on pregnancy or on the health of the foetus or newborn infant (see Properties/Effects). Data from epidemiological studies is not available. Animal studies did not show any reproductive toxicity (see Preclinical Data). Caution is advised for use during pregnancy. As a precautionary measure, Maltofer should only be taken after consulting a doctor.

## **Breast-feeding**

It is not known whether iron from the iron(III)-hydroxide polymaltose complex is excreted in human milk. Human milk naturally contains iron bound to lactoferrin. As a precautionary measure, Maltofer should only be taken during breast-feeding after consulting a doctor.

### **Undesirable effects**

The safety and tolerability of Maltofer<sup>©</sup> has been evaluated in a Meta-analysis of 24 publications or clinical study reports encompassing a total number of 1473 exposed patients.

Discoloured faeces are a well-known adverse drug reaction of oral iron medications but this is considered of no clinical relevance and is underreported. Other commonly seen side effects were gastrointestional disorders (Nausea, Constipation, Diarrhoea and abdominal pain).

**Table 1. Adverse Drug Reactions Detected in Clinical Trials and Post Marketing Setting** 

| System Organ<br>Class   | Very<br>common<br>(≥1/10) | Common<br>(≥1/100,<br><1/10)  | Uncommon<br>(≥1/1,000,<br><1/100)   | Rare<br>(<1/1,000)   |
|---|---------------------------|---|---|--|
| Gastrointestinal<br>Disorders   | Faeces*iscolo<br>ured     | Diarrhoea, nausea, abdominal pain (including: abdominal pain, dyspepsia, epigastric discomfort, abdominal distension), constipation | Vomiting(includi<br>ng: vomiting,<br>regurgitation),<br>tooth<br>discolouration<br>gastritis, |  |
| Skin and Subcutaneous Tissue Disorders  Nervous System                    |                           |   | Rash (including: rash, macular rash, bullous rash)**, pruritus urticaria**, erythema**.       |  |
| Nervous System Disorders  Musculoskeletal and connective tissue disorders |                           |   | Headache  | Muscle spasms (including: involuntary muscle contraction, tremor), myalgia |

## **Overdose**

In cases of overdosage neither intoxication nor iron overload have been reported to date.

There are no reported cases of overdose leading to acute iron toxicity nor iron overload.

## **Storage**

Keep all medicines out of reach of children.

Do not store above 30 °C.

Keep the glass bottle in the original package (i.e. outer carton) in order to protect from light.

#### **Presentation**

150 ml Type III brown glass bottle closed with tamper-evident screw cap. A measuring cup for administration covers the screw cap.

Manufactured by Vifor SA (Switzerland) for Vifor (International) Inc. (Switzerland) Information dated June 2020

<sup>\*</sup> Stool discolourations were reported in the meta-analysis at a lower frequency but they are generally a well known adverse drug effect of an oral iron therapy. For this reason, stool discolouration was classified under very common undesirable effects.

<sup>\*\*</sup> Events came from spontaneous reports after market introduction, with an estimated incidence of <1/491 patients (upper limit of 95% confidence interval)
